

Module 23: JOINS & COMBINING QUERIES

Reference Tables Used:

Table: [Customers](#) [Orders](#)

The screenshot shows a SQL query editor with two tables displayed below the queries.

```
Select * from Customers;
Select * from Orders;
```

Results

| | CustomerID | CustomerName | ContactNumber |
|---|------------|---------------|---------------|
| 1 | 1 | John Doe | 123-456-7890 |
| 2 | 2 | Jane Smith | 234-567-8901 |
| 3 | 3 | Alice Johnson | 345-678-9012 |
| 4 | 4 | Bob Brown | 456-789-0123 |
| 5 | 5 | Carol White | 567-890-1234 |

| | OrderID | OrderDate | CustomerID | Amount |
|---|---------|------------|------------|--------|
| 1 | 1 | 2023-06-01 | 1 | 150.00 |
| 2 | 2 | 2023-06-03 | 2 | 200.00 |
| 3 | 3 | 2023-06-05 | 3 | 300.00 |
| 4 | 4 | 2023-06-07 | 6 | 250.00 |
| 5 | 5 | 2023-06-09 | 7 | 175.00 |

Table: [Table1](#) [Table2](#)

The screenshot shows a SQL query editor with two tables displayed below the queries.

```
Select * from Table1;
Select * from Table2;
```

Results

| | ID | Name | Value |
|---|----|---------|-------|
| 1 | 1 | Alice | 100 |
| 2 | 2 | Bob | 200 |
| 3 | 3 | Charlie | 300 |
| 4 | 4 | David | 400 |
| 5 | 5 | Eve | 500 |

| | ID | Name | Value |
|---|----|---------|-------|
| 1 | 3 | Charlie | 300 |
| 2 | 4 | David | 400 |
| 3 | 5 | Eve | 500 |
| 4 | 6 | Frank | 600 |
| 5 | 7 | Grace | 700 |

1. What are JOINS?

Definition:

A **JOIN** is used in SQL to **combine data from two or more tables** based on a related column (usually a primary and foreign key).

Why use JOINs?

- To fetch data spread across multiple tables
- For combining customer info, order data, employee details, etc.

Types of Joins:

| Type | Description |
|-------------------|---|
| INNER JOIN | Returns only matching rows from both tables |
| LEFT JOIN | All rows from the left table + matched rows from the right |
| RIGHT JOIN | All rows from the right table + matched rows from the left |
| FULL JOIN | All rows when there is a match in either table |
| CROSS JOIN | Returns the Cartesian product (every row from one joined with every row from another) |

Common SQL JOIN Syntax

```
SELECT  
A.column1, A.column2,  
B.column1, B.column2  
FROM  
TableA AS A  
<JOIN_TYPE> JOIN TableB AS B  
ON A.common_column = B.common_column;
```

Example for All Joins (with tables: `customers` and `orders`)

| JOIN Type | Example |
|-------------------|--|
| INNER JOIN | <code>FROM customers INNER JOIN orders ON customers.customerid = orders.customerid</code> |
| LEFT JOIN | <code>FROM customers LEFT JOIN orders ON customers.customerid = orders.customerid</code> |
| RIGHT JOIN | <code>FROM customers RIGHT JOIN orders ON customers.customerid = orders.customerid</code> |
| FULL JOIN | <code>FROM customers FULL OUTER JOIN orders ON customers.customerid = orders.customerid</code> |
| CROSS JOIN | <code>FROM customers CROSS JOIN orders</code> (<i>no ON clause required</i>) |

2. INNER JOIN

Returns **only the matching rows** from both tables.

Syntax | Example:

```
SELECT customers.customerid, customers.customername,
       orders.orderid, orders.orderdate, orders.amount
  FROM customers INNER JOIN orders
    ON customers.customerid = orders.customerid;
```

Result: Only customers who placed orders.

The screenshot shows the SQL query for an INNER JOIN and its execution results. The query selects customerid, customername, orderid, orderdate, and amount from the customers and orders tables, joining them on customerid. The results table shows three rows of data where each customer has placed at least one order.

| | customerid | customername | orderid | orderdate | amount |
|---|------------|---------------|---------|------------|--------|
| 1 | 1 | John Doe | 1 | 2023-06-01 | 150.00 |
| 2 | 2 | Jane Smith | 2 | 2023-06-03 | 200.00 |
| 3 | 3 | Alice Johnson | 3 | 2023-06-05 | 300.00 |

3. LEFT JOIN (LEFT OUTER JOIN)

Returns **all rows from the left table (customers)** and **matching rows** from the right table (orders).

If no match, NULLs are shown for right table columns.

Syntax | Example:

```
SELECT customers.customerid, customers.customername,
       orders.orderid, orders.orderdate, orders.amount
  FROM customers LEFT JOIN orders
    ON customers.customerid = orders.customerid;
```

Result: All customers, even those with no orders.

The screenshot shows the SQL query for a LEFT JOIN and its execution results. The query selects customerid, customername, orderid, orderdate, and amount from the customers and orders tables, joining them on customerid. The results table shows five rows of data, including two rows for customers who have not placed any orders (customerids 4 and 5), where the right-side columns show NULL values.

| | customerid | customername | orderid | orderdate | amount |
|---|------------|---------------|---------|------------|--------|
| 1 | 1 | John Doe | 1 | 2023-06-01 | 150.00 |
| 2 | 2 | Jane Smith | 2 | 2023-06-03 | 200.00 |
| 3 | 3 | Alice Johnson | 3 | 2023-06-05 | 300.00 |
| 4 | 4 | Bob Brown | NULL | NULL | NULL |
| 5 | 5 | Carol White | NULL | NULL | NULL |

👉 4. RIGHT JOIN (RIGHT OUTER JOIN)

Returns **all rows from the right table (orders)** and **matching rows** from the left table (customers).

T & % Syntax | Example:

```
SELECT customers.customerid, customers.customername,
       orders.orderid, orders.orderdate, orders.amount
  FROM customers
 RIGHT JOIN orders
    ON customers.customerid = orders.customerid;
```

💡 Result: All orders, even if some customers are missing.

The screenshot shows a SQL query editor window. The query is:

```
SELECT customers.customerid, customers.customername,
       orders.orderid, orders.orderdate, orders.amount
  FROM customers
 RIGHT JOIN orders
    ON customers.customerid = orders.customerid;
```

The results pane displays a table with the following data:

| | customerid | customername | orderid | orderdate | amount |
|---|------------|---------------|---------|------------|--------|
| 1 | 1 | John Doe | 1 | 2023-06-01 | 150.00 |
| 2 | 2 | Jane Smith | 2 | 2023-06-03 | 200.00 |
| 3 | 3 | Alice Johnson | 3 | 2023-06-05 | 300.00 |
| 4 | NULL | NULL | 4 | 2023-06-07 | 250.00 |
| 5 | NULL | NULL | 5 | 2023-06-09 | 175.00 |

🔄 5. FULL OUTER JOIN

💡 Definition:

Returns **all rows when there is a match in either left or right table**.

If no match, NULLs are filled accordingly.

T & % Syntax | Example:

```
SELECT customers.customerid, customers.customername,
       orders.orderid, orders.orderdate, orders.amount
  FROM customers
 FULL OUTER JOIN orders
    ON customers.customerid = orders.customerid;
```

💡 Result: All customers and all orders, matching where possible.

```

SELECT customers.customerid, customers.customername,
       orders.orderid, orders.orderdate, orders.amount
  FROM customers
 FULL OUTER JOIN orders
    ON customers.customerid = orders.customerid;

```

100 % ▶

Results Messages

| | customerid | customername | orderid | orderdate | amount |
|---|------------|---------------|---------|------------|--------|
| 1 | 1 | John Doe | 1 | 2023-06-01 | 150.00 |
| 2 | 2 | Jane Smith | 2 | 2023-06-03 | 200.00 |
| 3 | 3 | Alice Johnson | 3 | 2023-06-05 | 300.00 |
| 4 | 4 | Bob Brown | NULL | NULL | NULL |
| 5 | 5 | Carol White | NULL | NULL | NULL |
| 6 | NULL | NULL | 4 | 2023-06-07 | 250.00 |
| 7 | NULL | NULL | 5 | 2023-06-09 | 175.00 |

6. CROSS JOIN

Returns the **Cartesian product** — every row from first table with **every row from second**.

```

SELECT customers.customerid AS CustID, customers.customername AS CustName,
       orders.orderid AS OrdID, orders.orderdate AS OrdDate, orders.amount AS OrdAmount
  FROM customers
CROSS JOIN orders;

```

Result: If 3 customers × 4 orders = 12 rows.

Use carefully on large data!

```

SELECT customers.customerid AS CustID, customers.customername AS CustName,
       orders.orderid AS OrdID, orders.orderdate AS OrdDate, orders.amount AS OrdAmount
  FROM customers
CROSS JOIN orders;

```

Combining Queries (Set Operators)

7. INTERSECT

💡 Definition:

Returns **common rows** from both queries.

💡 Syntax | Example:

```
SELECT * FROM table1
```

```
INTERSECT
```

```
SELECT * FROM table2;
```

Result: Only rows present in both `table1` and `table2`.

The screenshot shows the SQL Editor window with the following code:

```
SELECT * FROM table1
INTERSECT
SELECT * FROM table2;
```

The Results tab displays the following table:

| | ID | Name | Value |
|---|----|---------|-------|
| 1 | 3 | Charlie | 300 |
| 2 | 4 | David | 400 |
| 3 | 5 | Eve | 500 |

8. EXCEPT

💡 Definition:

Returns rows from **first query that are not present** in second.

💡 Syntax | Example:

```
SELECT * FROM table1
```

```
EXCEPT
```

```
SELECT * FROM table2;
```

Result: Data unique to `table1`.

The screenshot shows the SQL Editor window with the following code:

```
SELECT * FROM table1
EXCEPT
SELECT * FROM table2;
```

The Results tab displays the following table:

| | ID | Name | Value |
|---|----|-------|-------|
| 1 | 1 | Alice | 100 |
| 2 | 2 | Bob | 200 |

+ 9. UNION / UNION ALL

💡 Definition:

- **UNION** returns **unique** records from both queries.
- **UNION ALL** includes **duplicates**.

💡 Syntax | Example:

```
SELECT * FROM table1  
UNION  
SELECT * FROM table2;
```

-- OR with duplicates:

```
SELECT * FROM table1  
UNION ALL  
SELECT * FROM table2;
```

📝 Tables must have a **same number of columns** and compatible data types.

```
SELECT * FROM table1  
UNION  
SELECT * FROM table2;
```

The screenshot shows a SQL query window with the code above. Below it is a results grid with the following data:

| | ID | Name | Value |
|---|----|---------|-------|
| 1 | 1 | Alice | 100 |
| 2 | 2 | Bob | 200 |
| 3 | 3 | Charlie | 300 |
| 4 | 4 | David | 400 |
| 5 | 5 | Eve | 500 |
| 6 | 6 | Frank | 600 |
| 7 | 7 | Grace | 700 |

🧠 Key Points to Remember

- ✓ Use **ON** for join conditions, not just **WHERE**
- ✓ **LEFT JOIN** brings unmatched right rows as NULL
- ✓ **FULL JOIN** = all matched + unmatched rows
- ✓ **INTERSECT** = common only
- ✓ **EXCEPT** = remove common
- ✓ **UNION** = combine
- ✓ **UNION ALL** = combine + duplicates

Additional Tips

- ◆ Always use **aliases** for cleaner joins in big queries
 - ◆ Use **JOIN conditions properly** to avoid unexpected cartesian results
 - ◆ Prefer **INNER JOIN** if only matching rows are needed — more performance-friendly
 - ◆ Use **IS NULL** to detect non-matching rows after OUTER JOIN
 - ◆ Use **ORDER BY** at the end of combined queries if needed
-
